The History of Astronomy

Ancient Astronomy

(Ireland, Australia, Africa, Americas)

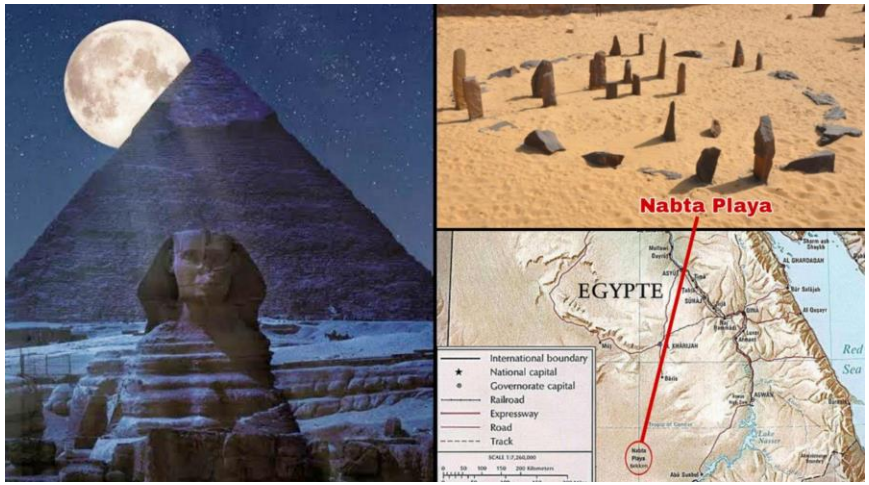
Ancient Babylonian, Egyptian

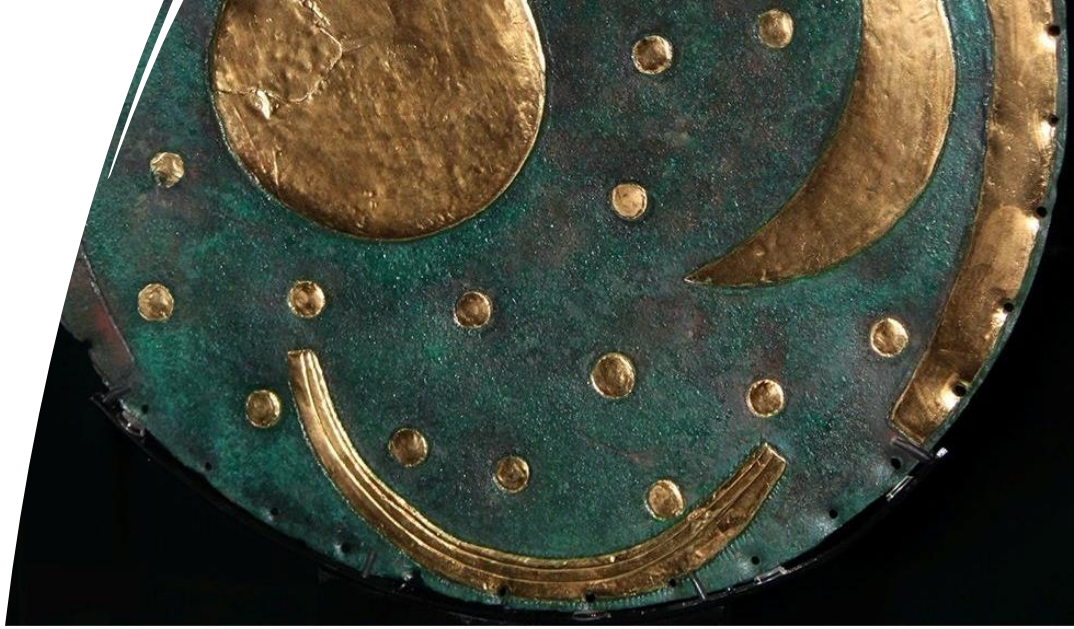
Greek, Chinese, Inca and Arab Astronomy

European Renaissance

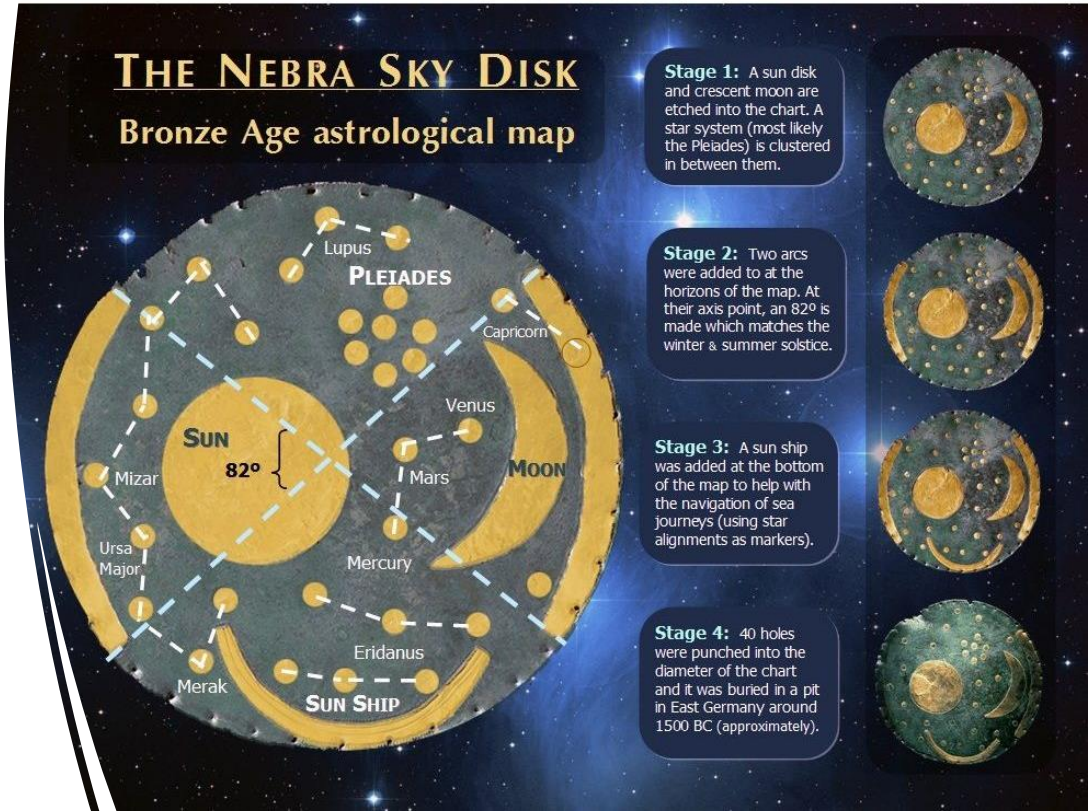
Modern Astrophysics

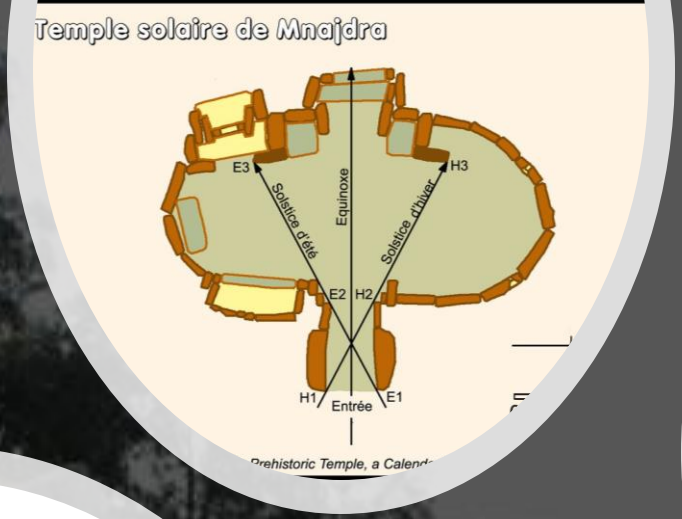
Nabta Playa 7500BC – considered to be the oldest astronomical observatory

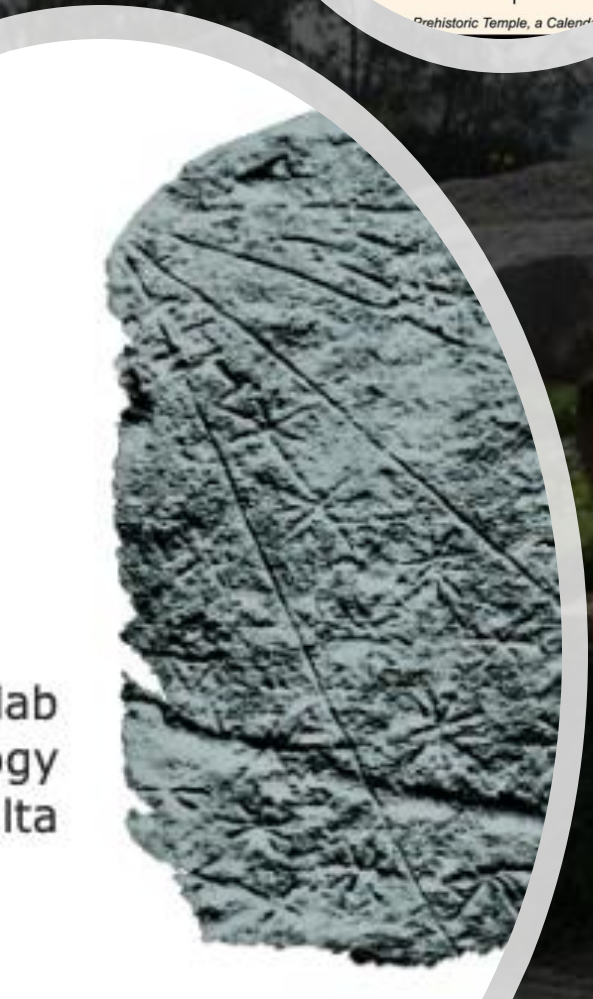




- The Nebra Sky Disc is widely believed to be **3,600 years old**, dating from the Bronze Age. The bronze disc was unearthed in Germany in 1999 and is considered one of the most important archaeological finds of the 20th Century.





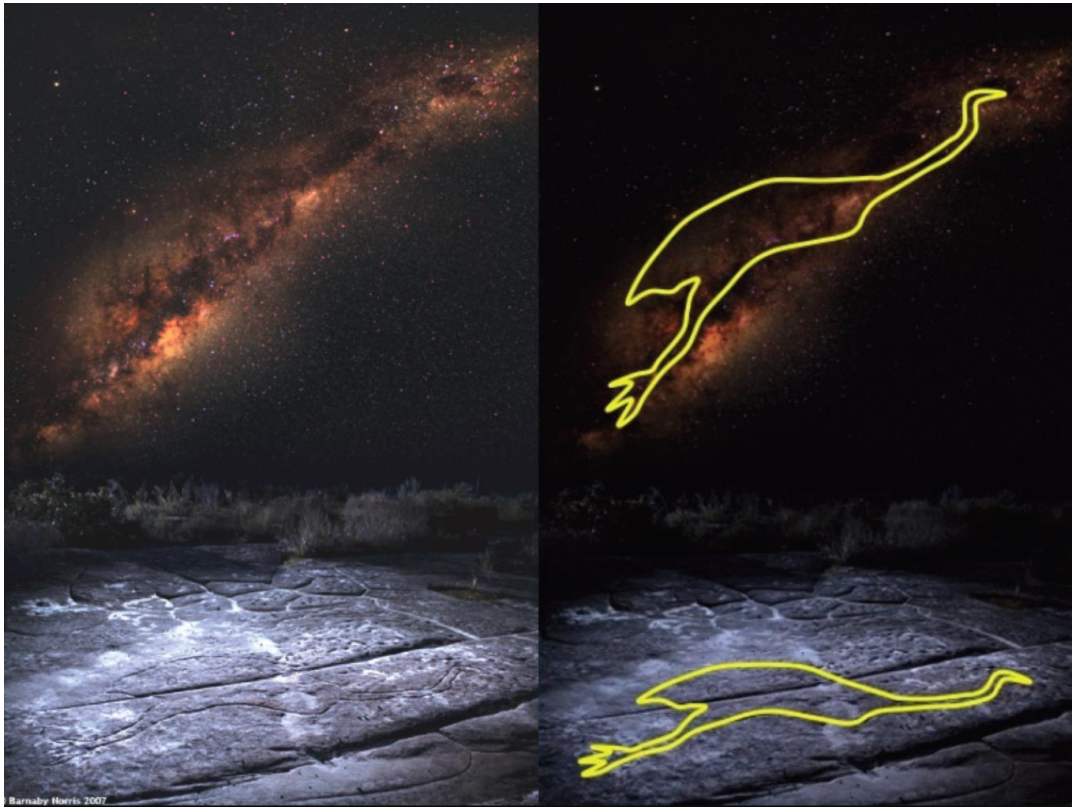


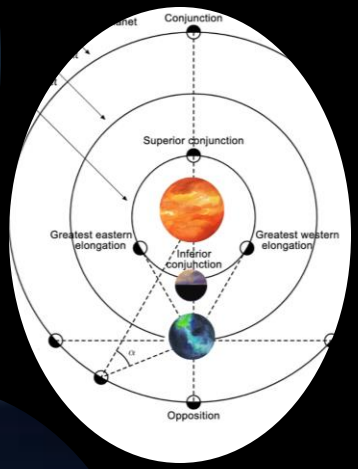
Malta's many pre-historic astronomical sites

Ku-ring-gai Chase National Park in Queensland Australia

5000 year old petroglyphs

Of galactic dust lanes



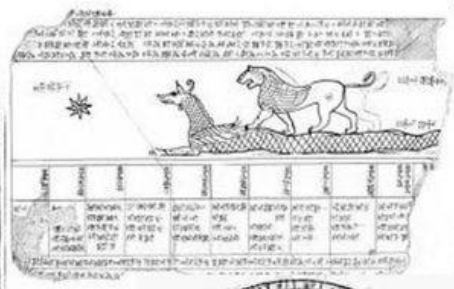


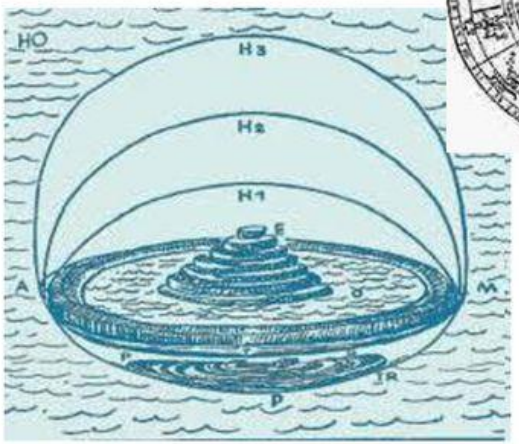
Enheduanna was the EN priestess of the moon god Nanna and Goddess Inanna (ususally associated with Venus) in the Sumerian city-state of Ur in the reign of her father, Sargon of Akkad.

Ancient stories about Inanna descending into the underworld (some of the first recorded religious texts) depicts what we now know is the planet Venus transforming from an evening to a morning star (a death and rebirth cycle)

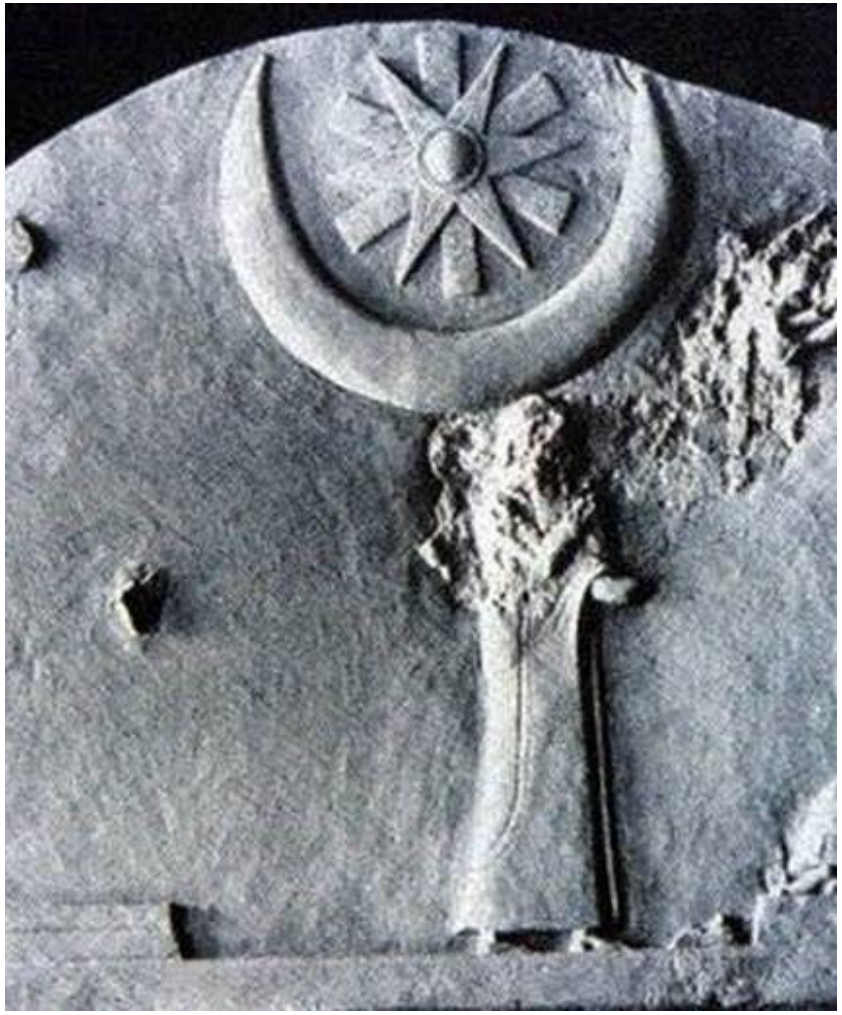
High priests and priestesses observed the stars and moon from the The Great Ziggurat of Ur

Babylonian Astronomers





- 1200 BC - 60 BC
- **Compiled star catalogs**
- First to divide circle into 360 degrees
- Made **calculations of daylength changes, planet motions and lunar eclipses**



A "star of Ishtar" was carved famously on a stele (kudurru) of King Melishipak of Babylon in 1100 BC, next to a bright crescent Moon and the Sun

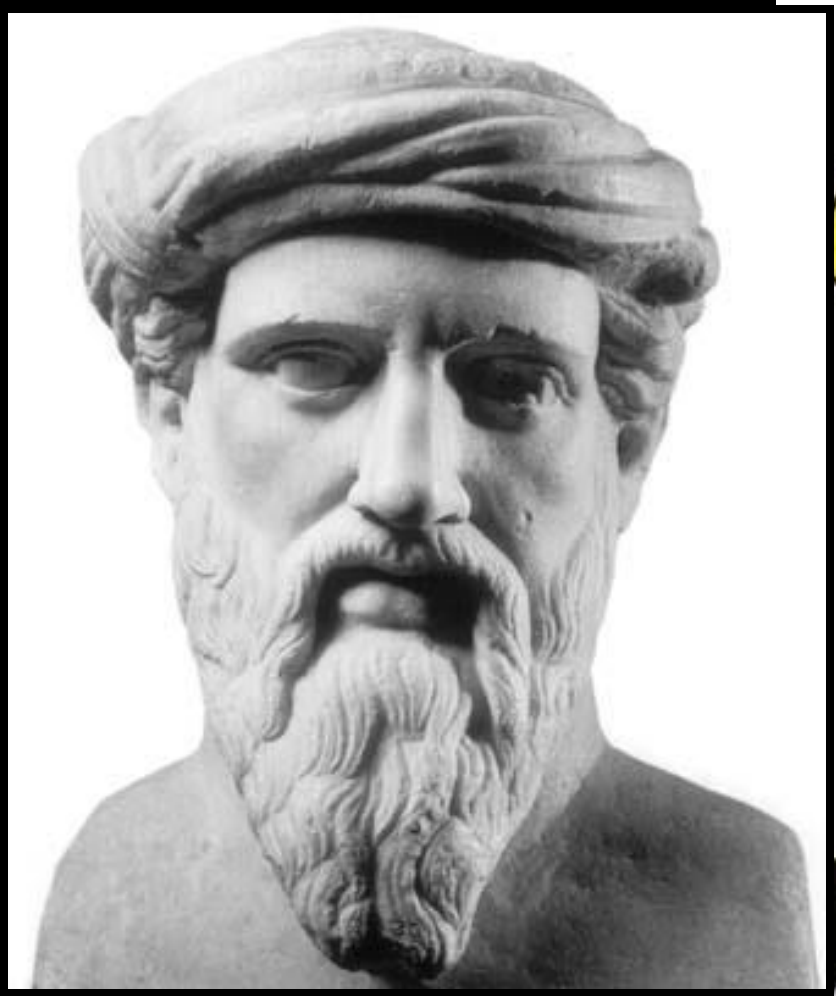
GREEK ASTRONOMY (650 BC - 150 AD).

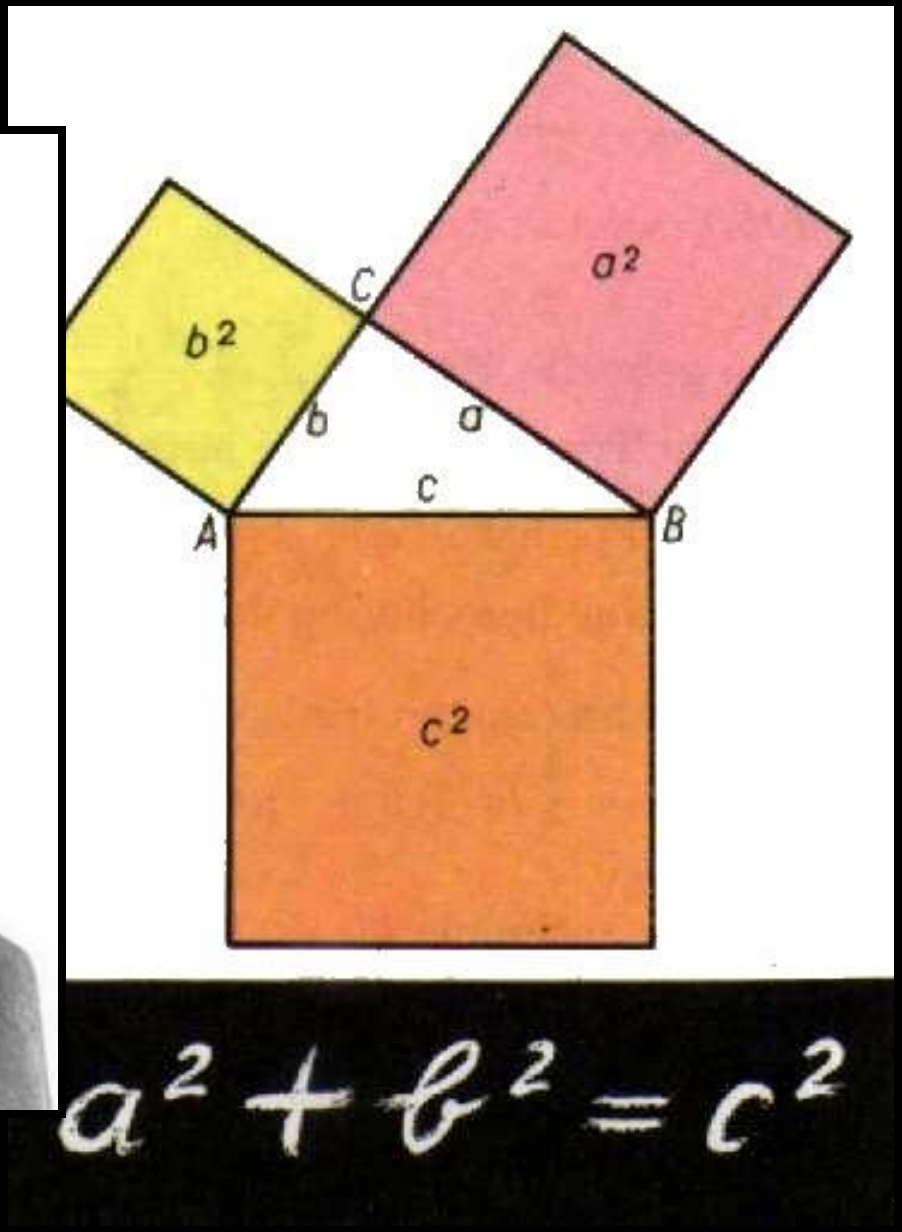
(1)Greeks were great theorists,
but poor observers or experimenters.

(2)Greeks used Babylonian records
& Greek geometry.

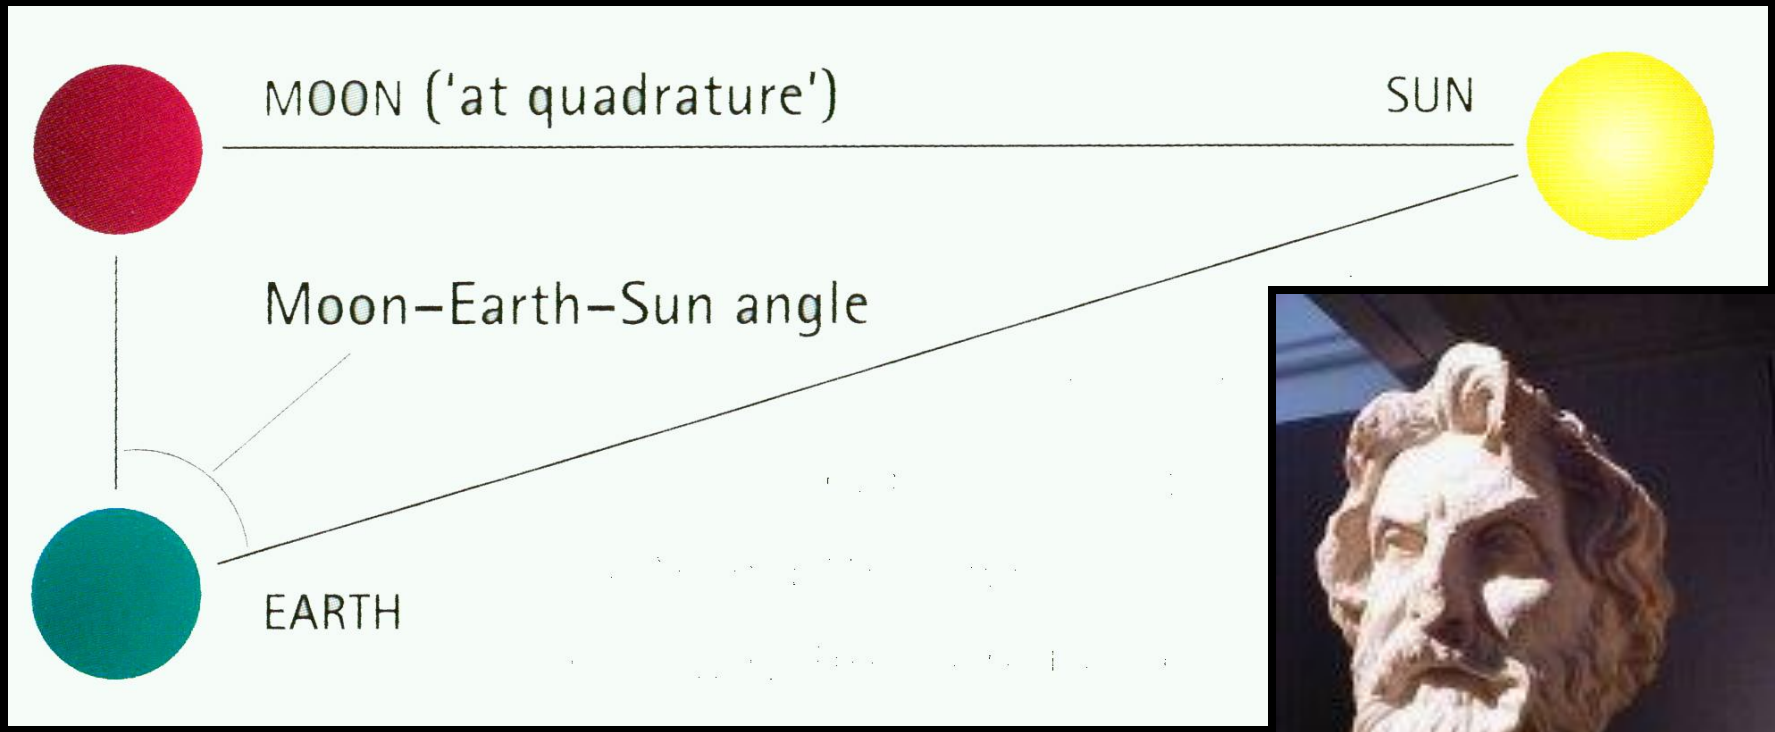
(3)Ionians (c 600 BC) - first Greek
cosmology. Impersonal *laws* replace
Mythology in some instances.

Pythagoras





Aristarchus (310 -230 BC) - How to measure the relative distances between the Earth, Sun and Moon

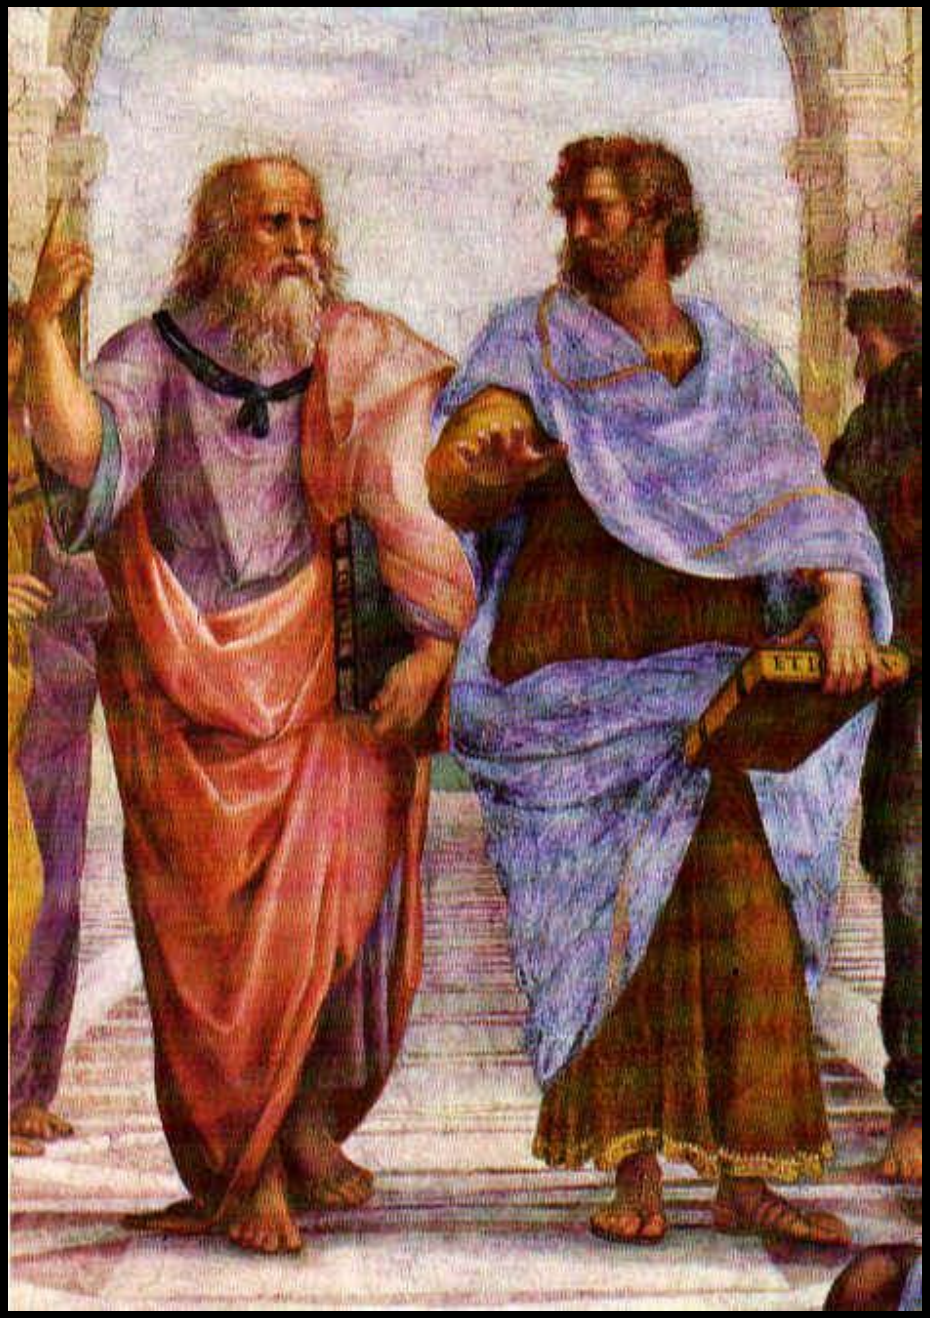


Aristotle & Plato

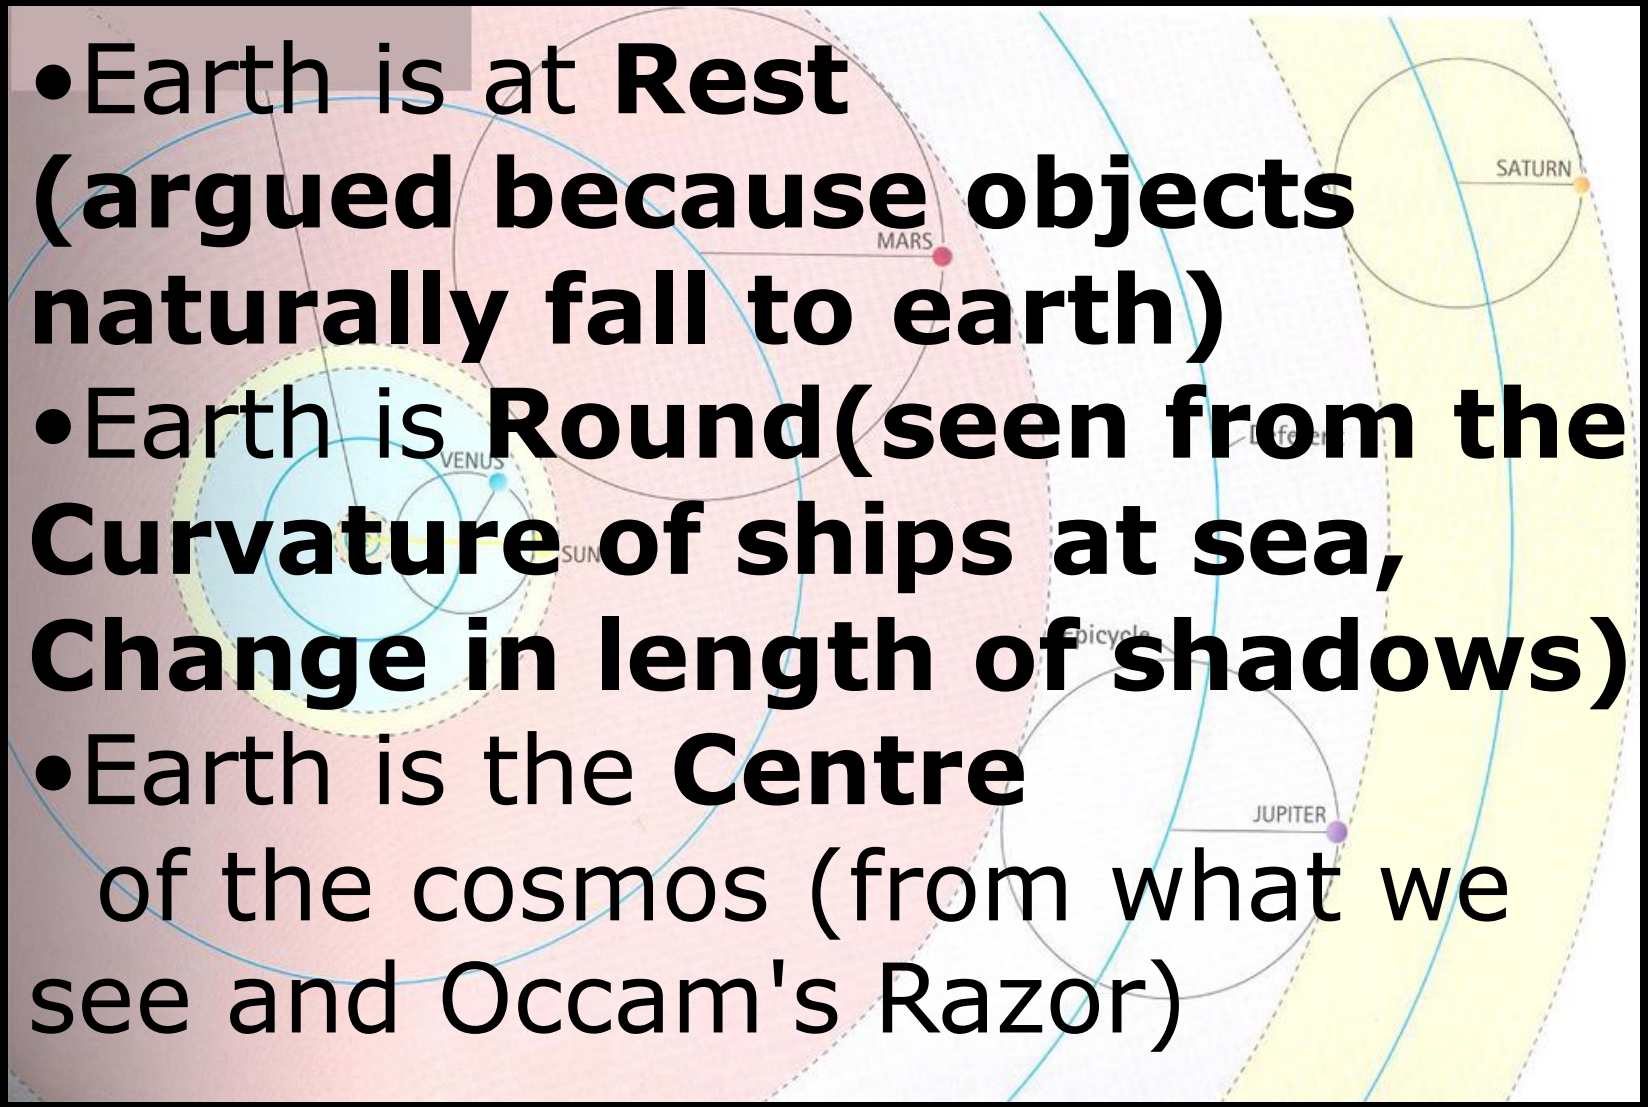
Plato is famous for developing theory of forms
In nature

(5)Aristotle (fl 350 BC)- Developed idea of Round earth at the centre of the cosmos.

Aristotle's cosmology is rooted in common sense & intuitive rationality - Sympathies and Antipathies



Aristotle's Cosmology



- Earth is at **Rest (argued because objects naturally fall to earth)**
- Earth is **Round(seen from the Curvature of ships at sea, Change in length of shadows)**
- Earth is the **Centre** of the cosmos (from what we see and Occam's Razor)

GREEK ASTRONOMY (650 BC - 150 AD).

(6) Celestial Sphere's motions are predictable, what about the 7 planets?

Plato (fl 400 BC) challenged geometricians to describe planetary motion in lawful terms.

This became Astronomy's project for next 2000 years.

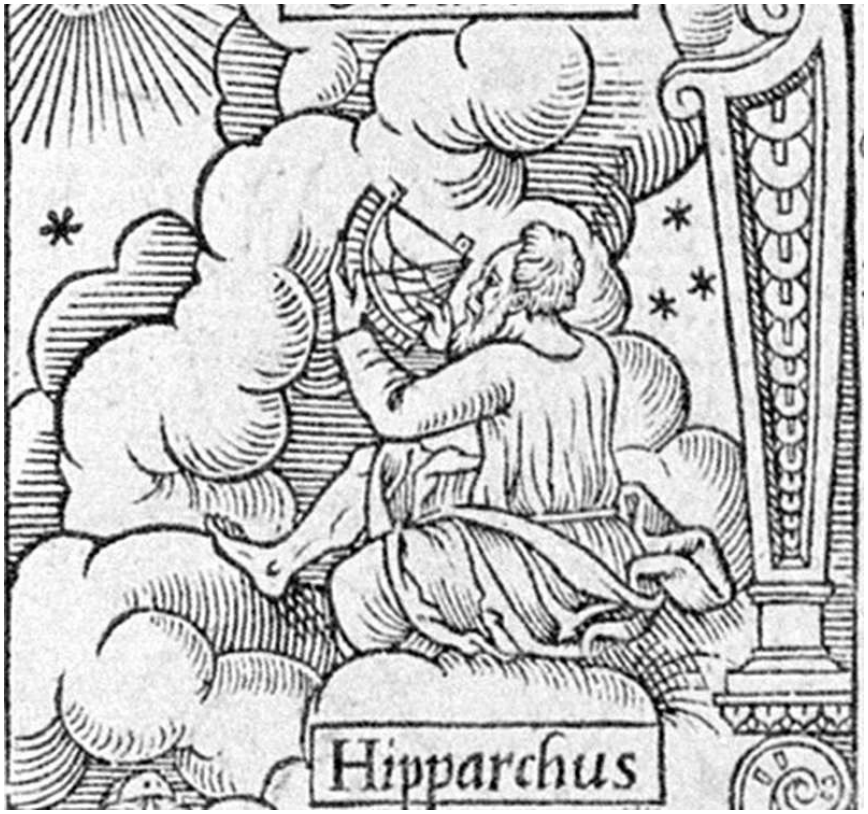
Ptolemy of Alexandria

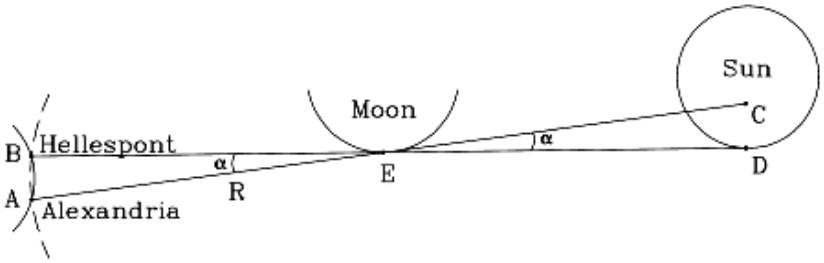
(7) The most elaborate Greek astronomer.

The "Almagest" (c 145 AD) gave mathematical model of planet's motions that could be calculated for any date, past or future.

- Hypatia Last of the great philosophers of Alexandria – killed by an angry mob

Hipparchus of Rhodes





Persian and Arab Medieval Astronomy

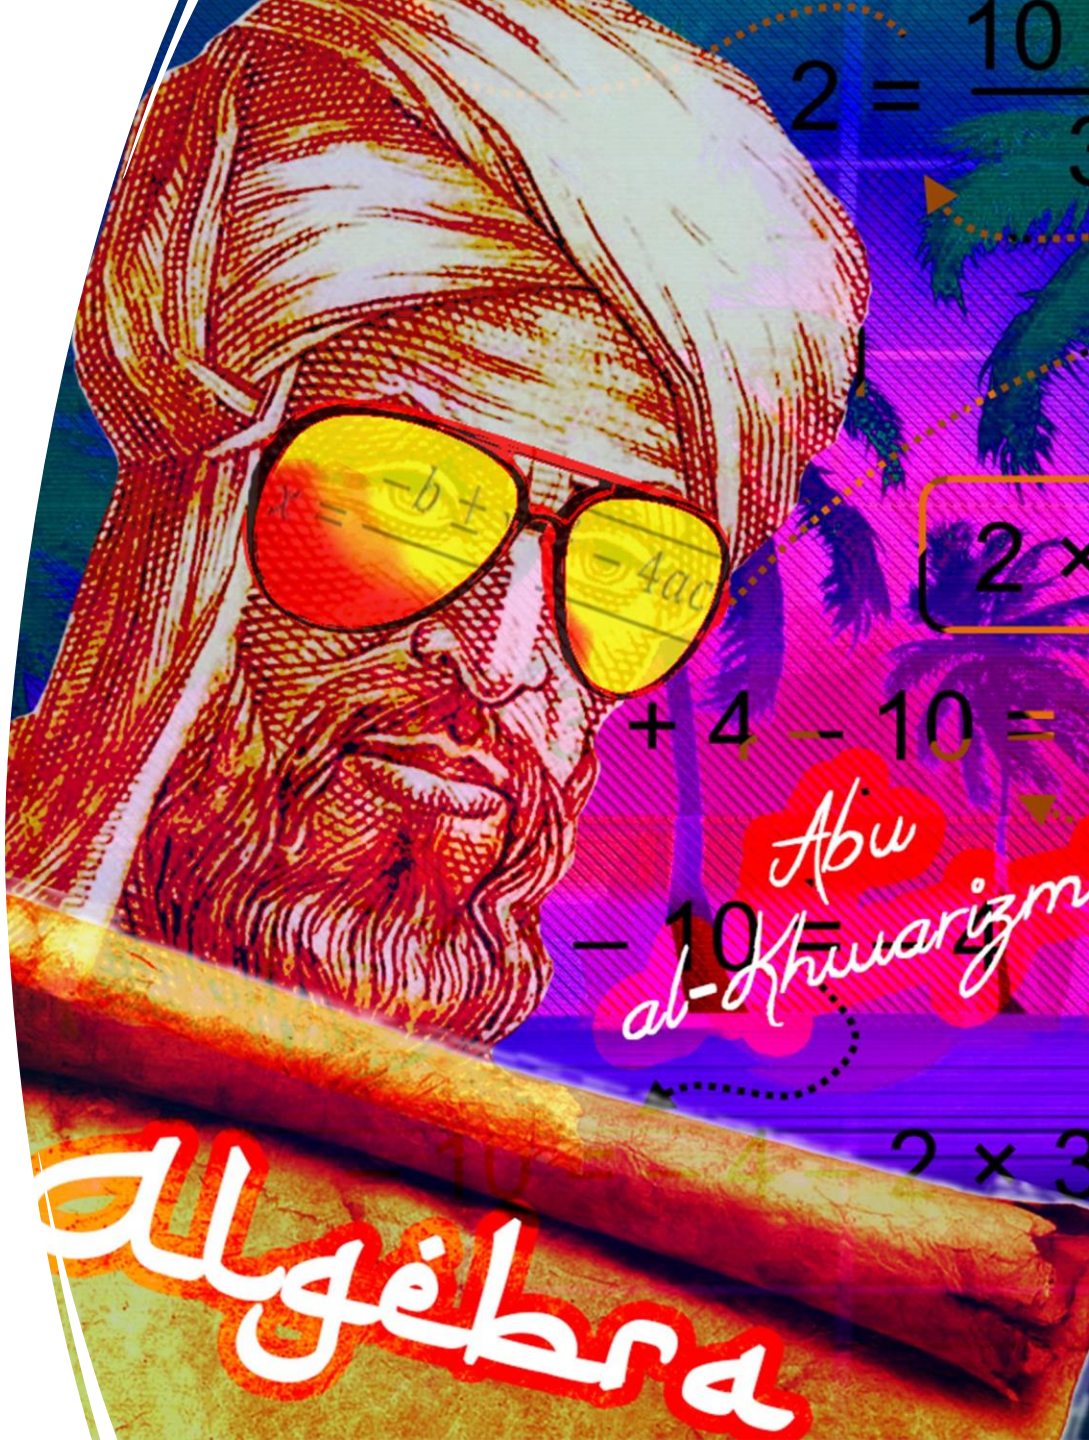
Early formal catalogues
- Names of brightest stars

Refined Greek Models
- Doubts about Ptolemy

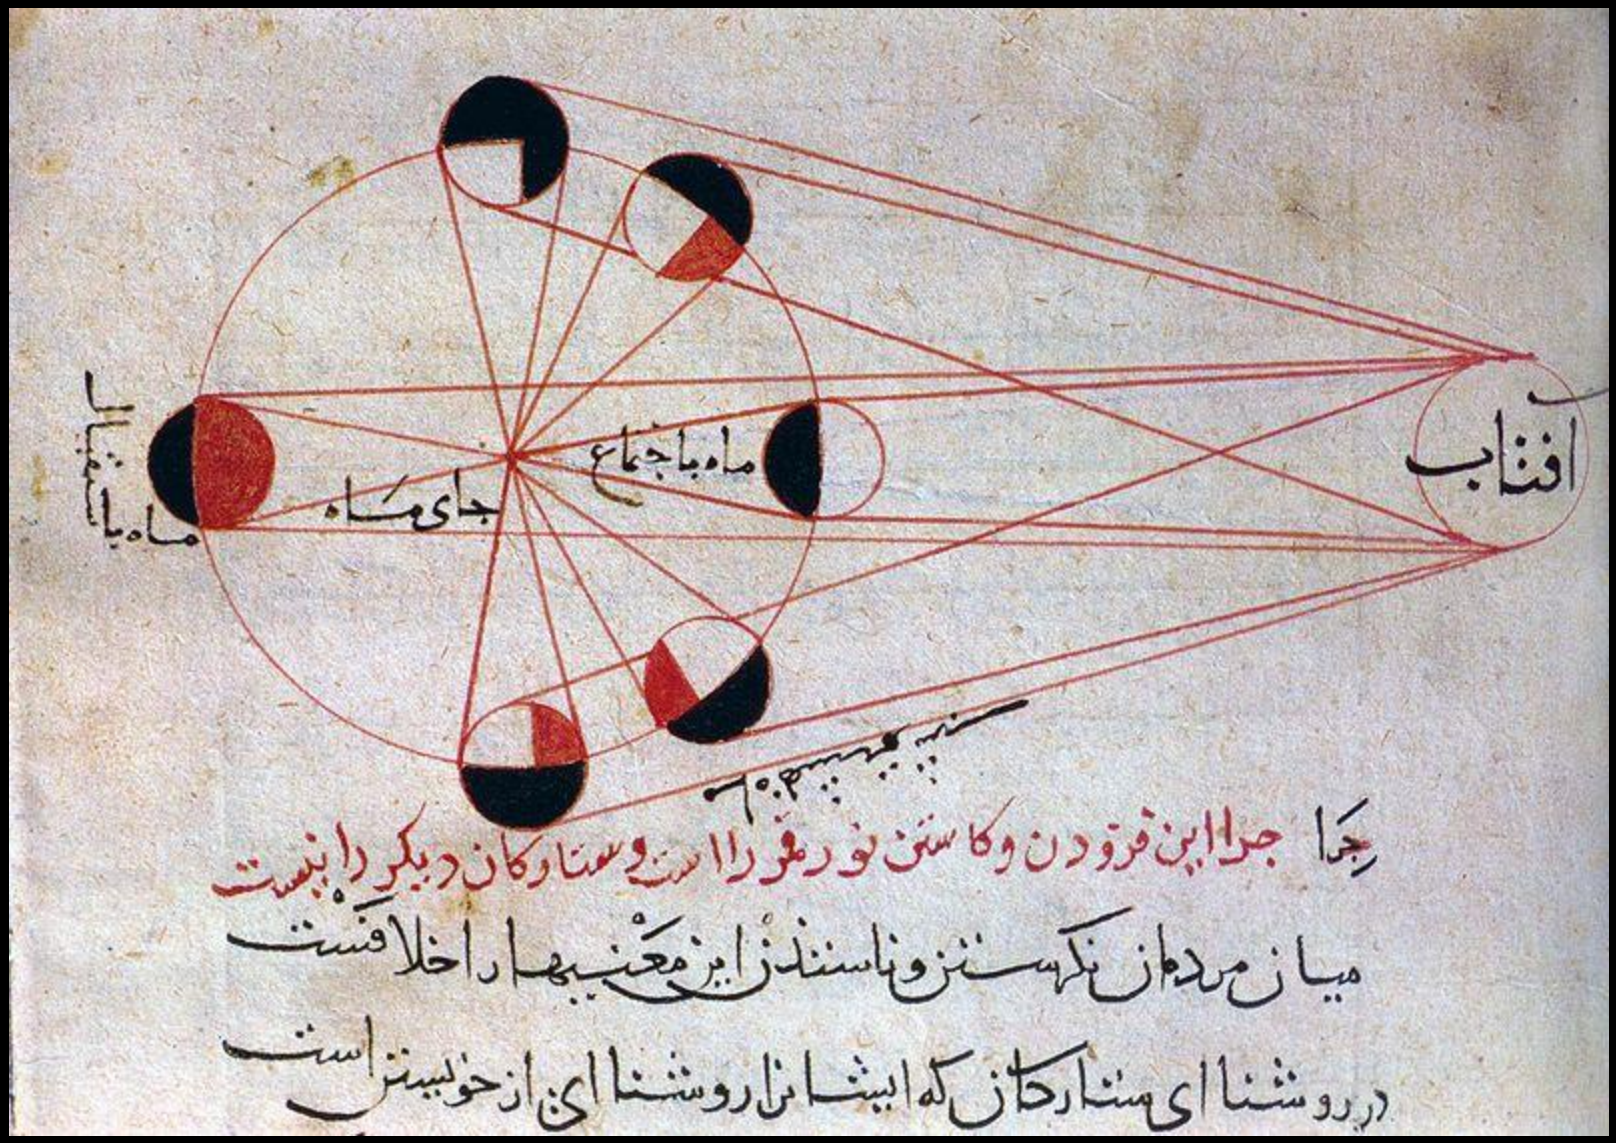
Advanced Mathematics
- Calculated movement

- **Persian al-Khwarizmi** in 830. The work contains tables for the movements of the Sun, the Moon, and the five planets known at the time. The work is significant as it introduced Ptolemaic concepts into Islamic sciences.

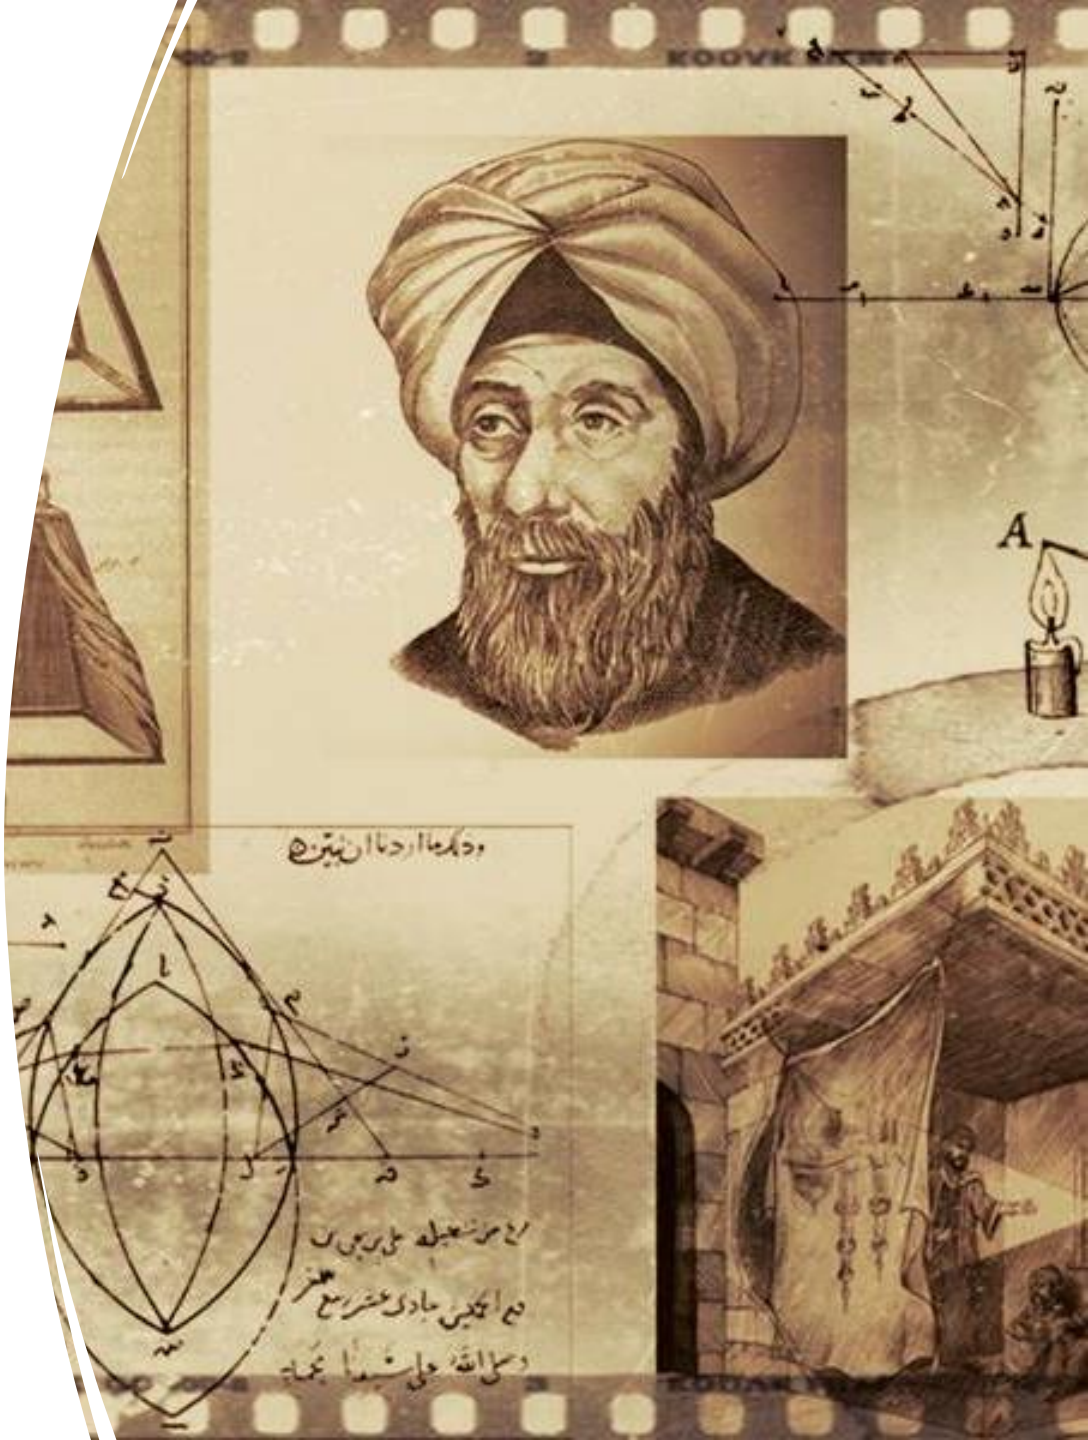
- Also invented algebra



Arab Medieval Astronomy



Ibn Al-Haytham (Alhazen) inventor of the camera obscura and pioneer in optics



Mayan Astronomers

- Civilization lasted for 2000 years, peaked between 300 and 900 AD
- Carefully studied the sun, moon, planets, especially Venus
- Predicted eclipses
- Their architecture was laid out with respect to astronomy
- Created two major calendaring systems, but the Long Count was calculated from August, 3114 BC

All over the world, across time, cultures have created patterns in the sky called constellations

- In Peru

Chinese Astronomers

- 600 BC onward
- **Compiled star catalogs**
- Used for **timekeeping**
- **Observed and predicted comets and eclipses**
- **First to record a** ‘guest star’, a **supernova**, in 185 AD.

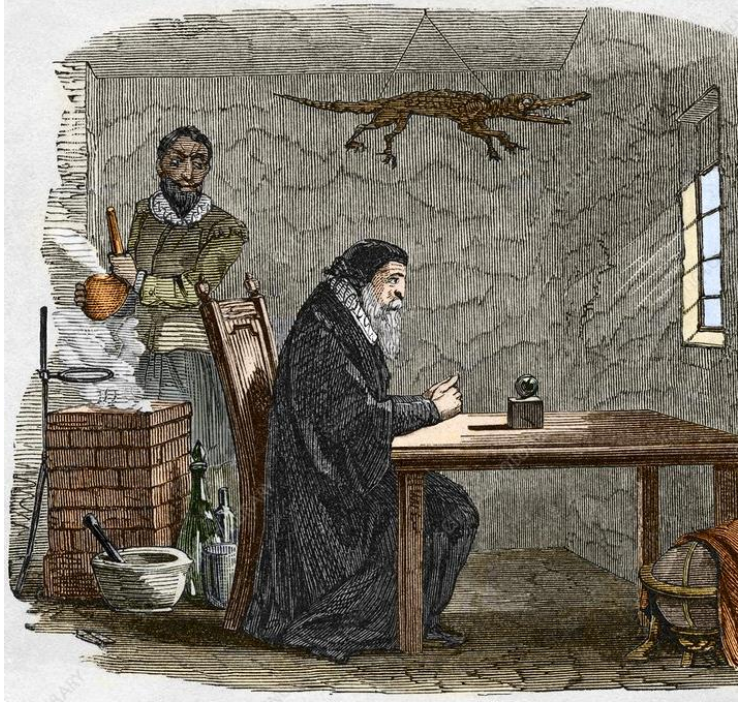
Meanwhile in Europe...Astronomy was used for Astrology

By figures such as John Dee and Francis Bacon

John Dee (13 July 1527 – 1608 or 1609) in many ways was a bridge between the occult ideas of nature popular in the Middle Ages and the Enlightenment Worldview that was to Emerge



Francis Bacon 22 January 1561 – 9 April 1626), and John Dee were rooted in the occult however they were beginning to rediscover some of the non-anthropomorphic laws of antiquity

Like Aristotle, Bacon believed it to be the 'nature' of light bodies to move upwards from the earth's surface, of heavy bodies to move downwards to the earth's surface. And all this notwithstanding Bacon's recognition that "what are called occult and specific properties, or sympathies and antipathies, are in great part corruptions of philosophy";[2] his assertion tha "my logic aims to teach and instruct the understanding ... that it may in very truth dissec nature, and discover the virtues and actions of bodies, with their laws *as determined in matter;* so that this science flows not merely from the nature of the mind, *but also from the nature of things*";[3] .

In short he had a theoretic avoidance of anthropomorphism in natural science.

This is actually a very important step – Nature is often counter-intuitive

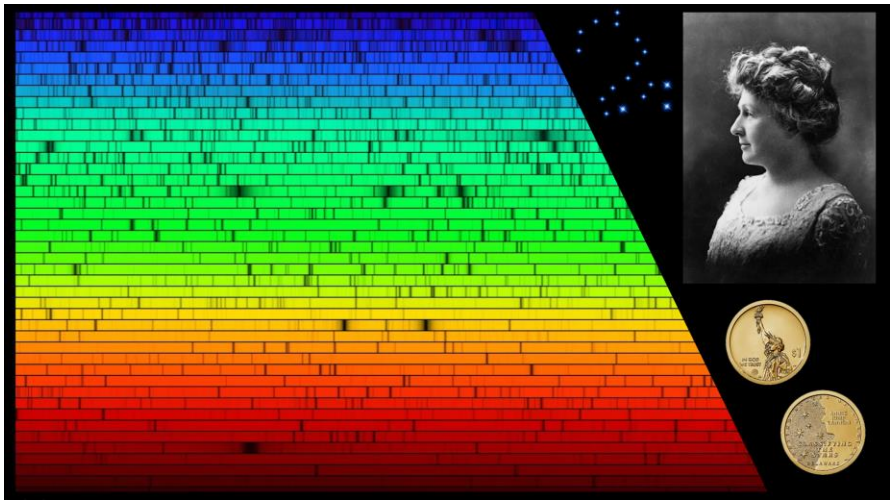
WOMAN MAKING INDEX OF 100,000 STARS FOR A CATALOGUE

Astronomer at Harvard Plans to Learn What Objects Are Made Of.

She Hopes to Have Little "Sheep of Sky" Ticketed In Two Years.

WHAT are the stars made of? This is one of the first questions asked by childhood. It was one of the first questions of a novice as to how Miss Cannon finds out what is in the stars, no guess could be more extraordinary than the plain scientific fact.



Cepheid Variables

History of Astronomy's Use of Cepheids

Henrietta Leavitt, a computer (data analyst) at Harvard made observations of more than 2500 variable stars, and knew that every variable star had an exact period where its luminosity would get larger and smaller and repeat. She wanted to know if there was a relationship between the period of the star and the maximum luminosity it reached. But there was a problem…

HENRIETTA SWAN LEAVITT

Astronomy **1868 - 1921**

- **Measured over 2000 Cepheid variable stars**
- **Discovered the Period-Luminosity Relation**
- **Leavitt's cosmic beacons used by Edwin Hubble for distance to galaxies**
- **Opened the way for measuring the universe**

"Miss Leavitt . . . . [was] steadfastly loyal to her principles, and deeply conscientious and sincere in her attachment to her religion and church. She had the happy faculty of appreciating all that was worthy and lovable in others, and was possessed of a nature so full of sunshine that, to her, all of life became beautiful and full of meaning."

– Solon I. Bailey, 1922
